The present invention provides single-stranded oligomucleotides which can be used for the targeted alteration of genomic sequences, where the oligomucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cetinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CHBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein B (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), anyloid precursor protein (APOE), presentilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesteroleamia, thalassemia, sickle cell anaemia, hallelmer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Domain
                              Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, Grb2-related with Insert Domain; GRID; T-cell; co-stimulatory adaptor protein; tissue rejection; graft rejection; leukaemia; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid(s) for regulating the Grb2-related with Insert I (GRID) gene comprises using antisense and enzymatic nucleic acid molecules such as hammerhead ribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô

The present invention relates to oligonucleotides that downregulate the expression of human GPL2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leuksemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' or 3' and 3' intron-exon junctions, 5' or 3' or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an artiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antialergic, antialergic, antialergic, antialergic, antialergic, antialergic, antialergic, antialergic, antialergic, composition may have a use in antisense gene therapy. The composition may have a use in antisers gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also composition a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine cronding inflammation, lung altergies, or respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The present sequence represents an antisense oligonucleotide directed against the human protein kinase A-RI-alpha gene. The antisense oligonucleotides is useful as a carcinostatic agent, e.g. for treating leukaemia, large intestinal cancer. Tectal cancer, colon cancer, cancer of the lung or stomach, hepatic cancer, malignant lymphoma, cancer of the tongue, oesophagus, breast, uterus or pharynx, brain tumour, melanoma, or

                                                                                                                                                         The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins as associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders is a patient's genome that affect the activity of gene 216 by expressing in a patient's genome that affect the activity of gene 216 protein, by inserting the nucleic acids into a host secreted Gene 216 protein, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic sassays to detect and quantitate the presence of similar nucleic acids and complementary sequences may also be used as antigens in sequences in samples and therefore which patients may be in need of restorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 and in assays to identify and antagonists may also be used to down regulate expression and activity. The anti-Gene 216 antibodies and antagonists may also be used as diagnostic general civity. The anti-Gene 216 antibodies and antagonists may also be used as diagnostic cagnits for detecting the presence of Gene 216 proteins in samples of the prevented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present cagnumented, diagnosed and difficultion using single strand conformation. The primers are used in the physical mapping of the gene (ABZ72067-ABZ72089), polymorphism identification using single strand conformational polymorphism (Second and genetyping (ABZ72184),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

The invention relates to antisense compounds, compositions and methods for modulating the expression of carreticulin. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human cells or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmune disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also targetted to human calreticulin. This sequence is an antisense compound antisense that the configuration of calreticulin expression-phosphorothioate 2'-MOE gapmer oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to nucleic acid encoding calreticulin, useful for treating a human having disease or condition associated with calreticulin e.g. cancer, viral infection, autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises antisense oligonucleotides which are targeted to the coding region of the human helicase-moi gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of human helicase-moi in cells or tissues, and for treating a helicase-moi-associated condition. The antisense oligonucleotides of the invention may also be used to delay infection, inflammation and tumour formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention, NOTE: The present DNA sequence has a phosphorothioate bases 1-5 and 16-20 are 2'-
                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound for modulating expression of human helicase-moi and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCAl; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer;

The present invention describes a method (M1) for designing capture oligomucleotide probes (I) for use on a support to which complementary coligomucleotide probes (II) will hybridise with little mismatch, where coligomucleotide probes (II) will hybridise with little mismatch, where coligomucleotide probes (II) will hybridise with little mismatch, where coligomucleotide probes (II) will hybridise with little mismatch, where coligomucleotide diseases (II) will hybridise with little inflectious agents coliforations agents e.g. Gryptococcus neoformans, Candida albicans and infectious agents of Aspergillus fundgatus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Bar virus and pollo virus, and parasitic infectious agents calcusts. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Concer is specifically associated with a gene selected from Bachl gene, cancer is specifically associated with a gene selected from Bachl gene, pasticular sites and identifying if ligation of the oligomucleotide probe sets occurred and correlating (using e.g. a scanning catetor microscope and infrared microscope) the support at the presence or absence of the target mucleotide sequences. All gation to a presence or absence of the target mucleotide sequences. Ball gation to a feature it was a sequences used in the exemplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; mouse; ss; primer; gene 216; antiasthmatic; antiinflammatory; anorectic; chromosome 20p13-p12; single nucleotide polymorphism; SNP; gene therapy; respiratory disease; asthma; obesity; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel isolated mucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single mucleotide polymorphisms (SNP's) which may be used as markers for disease usceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anorectic activities and may be used in gene therapy. The nucleotides or its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), observed; or inflammatory bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the combinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The

This invention relates to a novel agent for inhibiting or reducing the elevated expression levels of polo-like kinase I (PLKI), which are associated with the development and progress of proliferative diseases, such as cancer. Specifically, PLKS are serine, threonine kinases that play key roles in mitotic progression, contribute to centrosome maturation, bipolar spindle formation and are key regulators of cytokinesis. The present invention describes agents where at least one short interfering RNA (siRNA), preferably an shRNA (hairpin), or antisease RNA is directed against the PLKI agene as active agent. Additionally, the agent comprise a nuclease inhibitor, for example, aurin tricarboxylic acid (ATA) and an RNA specific promoter such as the US of H promoters. Accordingly, the siRNAs targeted against human PLKI are valuable antiproliferative agents and likewise the phosphorothioate antisease specific oligonucleotides (ASOS) which hybridise with human PLKI mRNA, inhibit PLKI expression in tumour cells, such that they can be described as having cytostatic activity. This oligonucleotide sequence is the antisense oligo P7 located in the open reading frame that inhibits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABC transporter; ABCT; major histocompatibility complex; MHC; cytostatic; hyperproliferative; autoimmune disorder; antisense gene therapy; inflammation; tumour formation; immunosuppressive; antimicrobial; human; phosphorothioate backbone; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polo-like kinase I agent containing duplex RNAs antisense oligonuclectides and inhibitory peptides, useful for treating disorders with elevated PLK1 expression levels, such as proliferative diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a compound targetted to a nucleic acid molecule where the compound specifically hybridises with the nucleic acid molecule and inhibits expression of AFM or specifically hybridises with the nucleic acid molecule portion of an active site on the nucleic acid molecule. The inhibiting the expression of AFM in cells or thissues. The invention is useful for inhibiting the expression of AFM in cells or tissues. The invention is useful for treating an animal with hyperproliferative or therapeutics, prophylaxis, as research reagents and kits, for therapeutics, prophylaxis, as research reagents and kits, for discinguishing functions of various members of a biological pathway and in antisense gene therapy. The invention is also useful prophylactically e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence is an antisense oligo targetted to human ABC transporter MHC I DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound that hybridizes and inhibits the nucleic acid encoding ABC transporter major histocompatibility complex 1, for treating diseases or conditions such as a hyperproliferative or autoimmune disorder.

or New antisense oligonucleotides targeted to nucleic acids encoding hematopoietic cell protein tyrosine kinase, useful for diagnosing treating cancer (e.g. leukemia), inflammation, diabetes or viral infections.

Claim 3; Page 25; 59pp; English.

The invention relates to a compound targetted to a nucleic acid molecule encoding haematopoietic cell protein tyrosine kinase. The compound inhibits the expression of haematopoietic cell protein tyrosine kinase and it specifically hybridises with the nucleic acid molecule encoding the tyrosine kinase or with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the tyrosine kinase. The antisense compounds are useful for modulating the expression of haematopoietic cell protein tyrosine kinase and treating diseases or conditions associated with the expression of the tyrosine kinase, such as hyperoliferative disorders (e.g. cancer), inflammation, diabetes or a viral infection. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in the present functions of various members of a biological pathway. The present sequence is human haematopoietic cell tyrosine kinase antisense oligonucleotide

The present invention relates to a method for sorting genes. The method comprises producing first double stranded (ds) cDNA from mRNA by reverse transcription using a poly-T primer. The ds cDNA is then digested with a restriction ensyme that generates cohesive ends with overhanging single stranded sequence containing a constant number of nucleotides, and the digestion products are ligated to a set of ds DNA oligonucleotide adaptor has at one end, a sequence complementary to a possible overhang and the other end a primer-template sequence specific for the adaptor complementary sequence, and between these two ends the amplified in separate PCR assays, using for each a primer that anneals to polyT and a second primer, from a set that anneals to the CDNA specific primer-template sequences. Amplicons are finally sorted into non-redundant groups defined by the specific primer that annealed to the primer-template sequence and thus primed PCR. The method is useful for producing a collection of non-redundant cDNA groups, especially where every expressed-gene transcript in the original sample is represented by its own subgroup. The method is also useful for isolation, identification can analysis of genes, nalysis and diagnosis of diseases, for studying cell differentiation and in gene therapy. The present sequence was used to illustrate the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sorting genes into non-redundant groups, useful e.g. for gene isolation, diagnosis and in gene therapy, by amplifying cDNA fragments attached to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Virucide; hepatotropic; antiinflammatory; antiviral; OAS; murine; 2'-5'-oligoadenylate synthase; Flavivirus infection; PCR; primer; ss.
Tail primer #86 from primer set 256 used in gene sorting method.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from differentical egents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 231, 2974, 3035, 3054, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                            Human biallelic marker upstream amplification primer SEQ ID NO:5641.
                                                                                                                                                                                                                                                           Human genome, biallelic marker, high density disequilibrium map, genomic map, haplotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; maplification, single nucleotide polymorphism; SNP, PCR primer; amplification; single nucleotide polymorphism; SNP, PCR primer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1.7%; Score 14.4; DB 1; Length 21; 93.8%; Pred. The present invention relates to a method for identifying compounds (1) that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) can carture of cells from a non-bunan mammal (Flyr/Flyr or Flyr/Flyr; indicating resistance or sensitivity to Flavivirus infection); (b) creating cells with test compound; and (c) measuring activity of OAS gene reating infections by Flavivirus (e.g. hepatitis C; dengue; yellow fever and various forms of encephaltitis). Genomic OAS DNA and derived of infection, (b) in screening for are useful: (a) for treating Flavivirus infection, (b) in screening for are useful: (a) for treating Flavivirus or evaluating sensitivity of subjects to Flavivirus infection and their risk of developing severe forms of such infections. The present sequence is a por primer for murine OAS, which was used in an example from the
                                                                                                                                                                                                                                                                              Identifying stimulators of oligoadenylate synthase family genes, useful as antiviral agents against Flavivirus, also mutated genes responsible for sensitivity to virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      / Match 1.7%; Score 14.4; DB 1; Length 21; Local Similarity 93.8%; Pred. The present sequence is that of HIVpol7p41-16, a specific receptor (probe) used in an array system to detect a target sequence (see ACC84393). This sequence has I mismatch with the target. It is one of a set of Il specific receptors (see ACC84382-92) used in normalization of a pamchip assay as an example of the method of the invention. The invention constitution methods and arrays suited to correct for signal errors due to variation in sample preparation. Methods and compositions for performing quantitative array-based assays are provided. A reporter and an analyte consequent on the array used in the method contain an internal reference present on the array used in the method contain an internal reference which can be bound by the reporter. The method is useful for the identification of an analyte in a biological sample, particularly for use in expression profilling assay, genotyping, sequence determination by hybridisation, gene quantitation, gene abnormality analysis (MAPH), PCR, MASBA or TYRAS (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GAVB17; G-protein coupled receptor; receptor; antiinflammatory; antiasthmatic; gastrointestinal; cytostatic; nootropic; antiarthritic; antirheumatic; gene therapy; purinergic; PCR; primer; human; ss.

The present sequence is that of a forward PCR primer for human GAVE17, a novel purinergic G-protein coupled receptor. The forward primer, a reverse primer ADE8787 and a TagMan probe ADE8788 were used to examine GAVE17 mRNA expression levels in different tissues. High levels of GAVE17 mRNA expression levels in different tissues. High levels of GAVE17 proteins ADE85778 and nucleic acids ADE85777, fusion proteins, antigenic peptides and anti-CAVE-17 antibodies, recombinant expression vectors, host cells and non-human transgenic animals. Diagnostic, attagenis and non-human transgenic animals. Diagnostic, attagenist or inverse agonist of GAVE17 capable of modulating GAVE17 antagenist or inverse agonist of GAVE17 capable of modulating GAVE17 associated with nucleotide metabolism dysfunction (claimed), e.g. asthma, crohn's disease, carcinomas, multiple sclerosis, or rheumatoid arthritis, by administering the therapeutic composition to a patient. UYPI-) UNIV PITTSBURGH.

Chou F; Brown RH, Liu J, Hoffman E, Dysferlin polynucleotide, its mutant form useful for diagnosis and treatment of hereditary muscular dystrophies e.g. miyoshi myopathy and limb girdle muscular dystrophy.

Claim 4; Page 35; 136pp; English.

The present invention describes an isolated dysferlin DNA of 20-25 nucleotides in length, comprising a nucleotide sequence specifically selected from nucleotides 911-913, 929-948, 1019-1038, 1392-1411, 1424-

1443, 1484-1503, 1499-1518, 1543-1565, 1715-1734, 1714-1759, 2241-2260, 2864-2883, 2978-2997, 3057-3076, 3188-3217, 3252-3771, 4356-4375, 4665-4684, 5015-5034, 5610-5629, 5726-5735, 6035-6054, 6179-6198, 6243-6263 and 6229-6548 of the human dysferin nucleotide sequence given in AA36744. Dysferlin nucleotide sequences containing specific mutations can be used for diagnosing a patient, a foetus or a pre-embryo at risk of dysferlin gene in biological samples from patients. Alternatively, the dysferlin sample containing genomic DNA can be incubated with a biological samples from patients. Alternatively, the biological samples from patients. Alternatively, the biological sample senomic DNA can be incubated with a biological sample containing genomic DNA can be incubated with a restriction enzyme, preferably BanII, BSp12861, RsaI, HanI, HaeIII, BSp1286, NlaIV, NlaIII, BG91, AvaII, BSt281, PleI, HaeI, HaeIII, BSp1286, NlaIV, NlaIII, Eagl, HinfI, TfiI, SfaNI or FokI and the presence or absence of a restriction enzyme site in the sample is detected as an indication of the presence or absence of a particular mutation in the sample. Dysferlin polynucleotides are useful for treating hereditary muscular dystrophy-28 (LGMB-2B). Wh and LGMB-2B map to the human chromosome 2p12-14 region between the genetic markers D2S286. The present sequence represents a primer for human dysferlin

The present invention describes a bacterial cell having protection against conditions lethal to an unprotected bacterial cell, and which is obtained by subjecting a bacterial cell to treatment with a sublethal colled of stress. Also described are: (1) a nutritive composition comprising bacteria, and (2) a method of protecting a bacterial cell against stress by treating a bacterial cell with a sublethal level of stress consisting of thermal shock, osmotic shock, pH shock, oxidative stress, chemical stress, nutritional stress, UV-stress or cold stress. The new cells having protection against lethal conditions are useful in the fermentation of fermence by silfidobacteria and lactobacilli may be used in prophylaxis or treatment of ailments including gastrointestinal infections. The protected bacterial cells are more advantageous for use in large-scale processes than those unprotected cells. The present colling is used in the sequence represents a universal probe which is used in the present

RESULT 243 AAF23065

à

New nucleic acid encoding an N4 virion RNA polymerase for e.g. synthesizing RNAs of a desired sequence, RNAs for use as probes in hybridization studies or Southern or Northern blot analysis, and RNA:DNA

Sequence 19 BP; 3 A; 7 C; 3 G; 2 T; 0 U; 4 Other;

The intercalator pseudonucleotide is also useful for detecting sequence specific DNA (target DNA) in a mixture comprising nucleic acids, detecting a sequence specific RNA in a mixture comprising nucleic acids, for inhibiting a DNAse and/or RNAse, and modulating transcription of one or more specific DNA sequences. The present DNA sequence was used in the exemplification of the invention
(VRNAP) and its nucleic acid. The nucleic acid is used to make an N4 YRNAP which is useful: in the synthesis of RNAs of a desired sequence, RNAs for use as probes in hybridisation studies or Southern or Northern blot analysis, and RNA:DNA hybrids for nuclear magnetic resonance (RNR) structure determination; for in vitro studies of spliceosome assembly, splicing reactions and antisense experiments; for in vitro translation or microinjection; and for nucleic acid amplification. The present sequence is Bacteriophage N4 vRNAP gene terminator signal sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel intercalator pseudonucleotide useful for separating sequence specific DNAs from mixture comprising nucleic acids, or for detecting sequence specific DNA or RNA in a mixture comprising nucleic acid and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences (AAQ53077-Q53136) are used in the invention to detect specific genes without the use of radio-isotopes. Detection is carried out by hybridisation of denatured (ss) sample DNA with a (ss) nucleic acid probe, complementary to the target sequence. Hybridisation occurs on the surface of an electrode or optical fibre and detection is visualised by the addition of an entity that recognises (ds) hybridised DNA and is electrochemically / photochemically active
                                                                                                                                                                                                                                                                             detection, radio-isotopes, target gene, electrode, detection; cal fibre, hybridise, hybridisation, electrochemical; photochemical;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection method of gene without using radio-isotope - by hybridisation of nucleic acid probe which is single strand having complementary sequence of gene and single strand denatured sample DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences (AAQ58558-61) are antisense oligonuclectides that are used to inhibit the production of interleukin-1-beta (AAQ58462). The oligonuclectides are useful for the inhibition of inflammatory diseases such as chronic joint rheumatism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human papilloma virus; primer; detection; diagnosis; genital; oral; carcinomas; research; PAP88; specific; MY48; internal; typing; PCR; ss.

The probes and primers AAV44608-T44633 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAV44733-T44906, which are based on and amplify fragments of the 11, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods. is done with probes derived from consensus sequences found in all characterised HPV sequences. Primers AAV4451-2 are used to amplify a fragment of the
                                                                                                                                                                                                          The human papilloma virus (HPV) specific primers AAQ98655-Q98662 were used to amplify HPV nucleic acid sequences. The amplified sequences were then screened using labelled probes, which detected and/or typed the HPV sequences for research or diagnostic purposes, e.g. to identify HPV that are implicated in genital or oral carcinomas. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid hybridisation probes - specific for selected human papilloma
consensus primer pairs and pref. detection with generic or type specific probes for use in research and diagnosis.

AAT AAT 14345-T47374 represent variants of a universal primer sequence (see AAT 47344) derived from the bacteriophage vector M13mp18. This sequence can be used as half of the DNA primer of the invention. The primers are used for amplification of a target DNA sequence, and can be used in a multiplex PCR amplification. The primers have the sequence 5'-XY-3', where X is a sequence that does not hybridise to the target sequence of such as this sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the transperson to into a sequence of other sequences) is 60 degrees C. During early cycles of amplification, products are synthesised that contain the chimeric primers on either end. The primers then serve as high stringency recognition sequences for subsequent rounds of and their targets in a multiplex amplification reaction is normalised, thereby reducing preferential amplification reaction is normalised, thereby reducing preferential amplification reaction is normalised, commerce to comprise a 5' universal domain and a 3' target-specific domain. They are used for the simultaneous PCR amplification of multiple defined targets e.g. to detect mutations in genes like the multiple defined targets e.g. to detect mutations in genes like the multiple defined targets e.g. to detect mutations in genes like the contained the presence of multiple defined targets e.g. to detect mutations in genes like the manner of the presence of multiple defined targets of the conductance regulator (CFTR), the Milms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                containing a mutated codon. The method involves: either cleaving a human subject's genomic DNA with a restriction enzyme to produce DNA fragments and treating the fragments to obtain single-stranded DNA molecules or solating the subject's polyA+ mRNA, contacting the single-stranded DNA molecules or polyA+ mRNA under hybridising conditions with a labelled synthetic DNA molecule, optionally bound to a solid support, comprising 12-20 nucleotides, where the synthetic DNA molecule is 5'-B-0-D-3' in the case of single-stranded DNA or is complementary to 5'-B-0-D-3' in the case of single-stranded DNA or is complementary to 5'-B-0-D-3' in the case of single-stranded DNA or is complementary to 5'-B-0-D-3' in the case of polyA+ mRNA, B = 0-9 nucleotides having a sequence complementary to a sequence of the activated ras gene 5' of the mutated codon, D = 0-12 nucleotides having a sequence complementary to a sequence in the activated ras gene 3' of the mutated codon, provided that B and D contain a total of at least 9 nucleotides, and Q is complementary to the mutated codon, treating the resulting hybridised molecules under conditions permitting only fully complementary molecules under conditions permitting only fully complementary molecules to remain hybridised, and detecting the present sequence represents the synthetic DNA probe used for detecting the activated N-ras gene when the mutated codon is at position 61 and has a single base substitution in the first or second nucleotide position so that it encodes an amino acid other than clud other tumours. (Updated on 25-WAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of activated ras gene - using oligo:nucleotide probes to detect mutated codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

minimal hybridization to a nucleic acid. A composition has also been minimal hybridization to a nucleic acid. A composition has also been developed comprising a set of TNA with a constraint region and a variable region, optionally with < 2 c nucleotides, where the variable region for each TNA has a similar Tm, G+C:A+T ratio and length, does not cross-hybridise to a probe NA, and preferably contains an even number of A+G nucleotides, each TNA when aligned with any other TNA of the set has at least 2 nucleotides different. An array of oligonucleotide probes comprising several experimental oligonucleotide probe sets attached to a colid substrate, where each set hybridises to a different target NA under stringent hybridisation conditions, each oligonucleotide probe in the set comprises a variable region, and where the NA probes do not cross hybridise in the array, is also new. The present sequence represents an auxotrophic ORF 20mer tag, which is used in an example of the present invention. The method of synthesising the TNA's and probes are designated permit massive parallel analysis of all the components, especially nucleic acids, in a mixture in a single assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Selection of sets of tag nucleic acids and generation of probe arrays -
for simultaneous detection of large numbers of nucleic acids in a sample.

This sequence represents a probe for the N-ras gene, that can be used in the method of the invention. The method is for for detecting a mutation from a non-mutated sequence of a target polynucleotide (TP) in a sample, but using a mismatch binding protein (MBP), comprises: (a) providing a non-cutated and mutated TP; (b) forming duplex of the non-mutated and complex strands of TP in (a); (c) adding a single strand binding protein to the polynucleotide from (b); (d) incubating MBP with an activating agent; (e) adding the incubated MBP from (d) to the con-mutated and one mutated single strand of TP; and (f) detecting the con-mutated and one mutated single strand of TP; and (f) detecting the greence of any MBP bound to TP. The method may be used for early diagnosis of cancer. Binding of MBP to single strands is inhibited by the single strand binding protein. By activating MBP with an activator, before addition to the sample, binding to double strands lacking
       Method for detecting mutation(s) by mismatch binding protein - useful for separating mutation from non-mutated target polynucleotide in sample, used in early diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compounds used to treat eg. hyperproliferative conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAZ37473-Z37738 represent human mdm2 phosphorothicate oligonucleotides.
AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human mdm2 gene; proliferation; tumour; phosphorothicate; p53; cancer; antisense; modulation; oligonucleotide; expression; inhibition; hyperproliferation; blood cancer; brain cancer; breast cancer; lung cancer; soft tissue cancer; psoriasis; fibrosis; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a human papillomavirus (HPV) L1 type-specific primer of the invention. This sequence may be used in conjuncture with L1 specific probes for detecting and typing HPV. Identification and typing of HPV is important as different types of HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MAR-2003 to correct PR field.)

These probes comprise 12-43 nucleotides of formula 5'-B-Q-D-3', Q=3 nucleotides complementary to the mutated codon, and B and D each = 0-0 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with point mutations
 The present invention describes
              novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Probes for detecting ras oncogene point mutations - useful for the diagnosis of cancer associated with single base mutations.

AAV73084-V73145 are oligomers used in a method to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5'-B-Q-D-3', Q=3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with point mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine; eye disease; conventional trachoma, nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs ancode polygeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal urctritis, englydmitis, cervicitis, salpingtis, perihappatitis, bartholinitis, penumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1.7%; Score 14.2; DB 1; Length 20; 84.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primers AAZ01426-Z06209 were used to amplify open reading frames encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. (see AAZ01425). These ORFs against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis, genital diseases such as nongoncoccal uretritis, peneumopathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

CORFS of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases uch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, engiquality, cervicitis, salpingtitis, perimpeptidis, paratracholinitis; phenumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (See AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypepides encoded by the open reading frames of the C. pneumoniae genome (see AAY34894- AAX3879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                               Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

This sequence represents a primer use to amplify and isolate clones which encode new proteins containing PDZ domains whose expression in human mublical vascular endothelial cells (HTVE) are enfanced by stimulation with tumour necrosis factor (TNF) alpha. The new protein is used to identify proteins which bind to it (particularly to the PDZ domains) and the genes encoding them, for use in the treatment of cell proliferation

Sequence 20 BP; 6 A; 3 C; 5 G; 6 T; 0 U; 0 Other;

disorders such as cancer

Protein containing PDZ domain, whose expression is enhanced by TNF stimulation - plays an important role in protein/protein interactions and is used for screening for proteins for use in treatment of cell proliferation disorders such as cancer.

Comparing AAZ56049-256050 are used to amplify beta-actin from wild type and NRATp.- cartilage cultures. The primers are used in the identification of the role that NRATp plays in cartilage cell growth and differentiation. The modulation of growth or differentiation of cartilage can be carried out through contacting cells deficient in the NFAT family genes, with a test compound. Modulating growth or differentiation of cartilage cells can achieved by contacting growth or differentiation of cartilage cells can achieved by contacting the cells with a modulator of NFAT activity, where the modulator comprises a peptidic compound derived from the calcineurin interacting region of NFATp. The methods of the invention are useful for modulating the growth or differentiation of cartilage cells and endochondral ossification useful for repairing bone defects and fractures in mammals including humans, monkeys, dogs, cats, mice etc. The compound that modulates cartilage cell growth and differentiation is useful for diagnosing disorders such as chondroblastoma, osteolastoma, fibrous dysplasia, ossifying fibroma, osteolastoma, osteolastoma, fibrous dysplasia, ossifying fibroma, osteolastoma, fibrous dysplasia, ossifying fibroma, osteolastoma, reduced or mutated) in the expression of NPATp in cartilage cell. NPATp inhibitory compounds are useful for treating disorders such as rheumatoid arthritis, osteoarthritis and creating disorders such as rheumatoid arthritis, osteoarthritis and creating disorders such as rheumatoid arthritis, osteoarthritis and creating disorders when a sheumatoid arthritis, osteoarthritis and creating disorders as the cartilage degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense oligonucleotide; phosphorothioate; TNFalpha; cytokine; inhibit; tumour necrosis factor alpha; inflammatory bowel disease; diabetes; rheumatoid arthritis; infectious disease; multiple sclerosis; hepatitis; panoreatitis; atopic dermatitis; allograft rejection; autoimmune disease;
                                                                                                                                                                                                                                                                                                                                 Modulating growth or differentiation of cartilage cells useful for treating chondrosarcoma, osteochondroma and arthritis in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1.7%; Score 14.2; DB 1; Length 20; 34.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (See AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY3484- AAY3879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an antisense of sequence without the tragets a region of the human timour necrosis factor alpha (TNFalpha) nucleotide sequence. TNFalpha is an important cytokine that plays a role in host defence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense inflammatory and autoimmune diseases. The invention relates to antisense oligonucleotides, such as that represented by the present sequence which are capable of modulating the TNFalpha gene expression. The oligonucleotides optionally have a phosphorothioate backbone, and may also optionally contain at least one 2.0 methoxyethyl modification. The oligonucleotides are useful for modulating the expression of human TNFalpha in cells and tissues, reducing a human cell inflammatory construction associated with TNFalpha include diabetes, inflammatory bowel disease, multiple solerosis, pancreatitis, rheumatoid arthritis, disease, multiple solerosis, pancreatitis or allograft rejection. The antisense oligonucleotides are also useful for modulating the confittion of entail for modulating the confittion of sequence in adipose tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human myocardium protein-7; MP-7; congestive heart failure; lar disorder; cardiomyopathy; PCR mapping study; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence is the reverse PCR primer designed from 3'UTR sequence of myocardium protein-7 (MP-7). This was used in PCR mapping studies to determine the chromosomal localisation of MP-7 gene. Specific amplification was carried on human and hamster cell line DNA. MP-7 is used to modulate a variety of cellular processes e.g. modulating the activity of proteins involved in cardiovascular disorders like congestive
Novel myocardium protein-7 polynucleotides, used to modulate a variety of cellular processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (IgM) protein. The IgM protein does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially rheumatism. The IgM molecule used in the invention has human Fas-antigen binding properties. Included in the invention are nucleotide sequences of the IgM light and heavy chains (see AAA78267-A78272) and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-human Fas humanizing antibody-containing antirheumatic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

moclectide sequences of the humanised anti-human Fas IG CHII (see AAAA8202-A78206) and protein sequences (see AABI2908-B12910). Also included are anti-human Fas antibody CDR peptides (AABI2902-B12907). Primers specific for the anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78213-A7826. Primers used for sequencing the human Ig DNA used in the invention are represented by sequences AAA78213-Farmers used for sequences AAA7827-A78318 and AAA78335. While humanised anti-Fas Ig DNA sequencing primers are represented by sequences AAA7827-A78318 and AAA78357. Finer sequences AAA78207-A78212 are specific for murine Ig DNA, and are used in the production of the agent of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an antisense compound (I), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antiinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (I) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modulation; signal transducer and activator of transcription;

         and/or neck, leukaemia, myelone, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various call functions, physiological processes and conditions and for diagnostic methods in detecting and determining the role of STAT3 in various call functions associated with expression of STAT3.

(I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human the present invention. AAC93151 to AAC93230 and AAC93232 to AAC93239 represent invention. AAC93151 to AAC93230 and AAC93230 represents a mismatch control oligonucleotide which are used in example

                                                                                                                                                                                                                                                                          The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothioate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha DNA
                                                                                                                                                                                                    Antisense compound 8 to 30 nucleobases in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.

                                                                                                                                                                                                                                                       The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                    Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cell proliferation; therapeutic;

                                                                                                                                                                   The present invention relates to compositions and methods for modulating the expression of human mdm2 gene, a naturally present cellular gene implicated in abnormal cell proliferation and tumour formation. The invention also provides antisense oligomucleotides which are targetted to the mdm2 gene and are capable of inhibiting the expression of mdm2 gene. The oligomucleotides are useful in diagnostics, therapeutics, prophylaxis and as research reagents. They are especially useful for inhibiting, diagnosing and treating abnormal proliferative conditions associated with mdm2. The method is useful for detecting and determining the role of mdm2 expression in various cell functions and physiological processes and conditions, and for diagnosing conditions associated with mdm2 conditions, mnd for diagnosing conditions associated with mdm2 conditions. The present sequence is human mdm2 antisense oligonucleotide (ISIS #1651s) with a phosphorothicate backbone. This sequence is
                                                                                                    New oligonucleotides 16506, 16507, 16518, 16520, 16521, 16522 and 16524, which inhibits human mdm2 expression, useful for inhibiting, diagnosing or treating abnormal proliferative conditions associated with mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amplifying nucleic acids with base sequences of mRNAs in sample while sustaining the ratio among them used to monitor mRNA expression, applicable in producing e.g. cRNA library and DNA microarrays.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon region) of a nucleic acid encoding human mdm2.
The present invention describes a method of amplifying nucleic acids, principly forming a single-stranded DNA to an mRNA in a sample with a primer, synthesising a DNA strand complementary to the single-stranded DNA to form a double-stranded DNA, adding a single or double-stranded adapter DNA to the double-stranded DNA, and amplifying the DNA strand using a second primer with a nucleic acid sequence in the adapter DNA this can be used to amplify nucleic acids to monitor mRNA expression, which is applicable in producing e.g. cRNA libraries, cDNA libraries, DNA microarrasys or membrane arrays in gene engineering and gene expression analysis, and in drug development and health maintenance and management.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1. .20

                                                                                                                                                                                                                                                            AAD36641/
                                                                                                                                ઠે
                                                                                                                                                                                                                                                                              Integrated to the 5' untranslated region, translation termination codon region, 3' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2. Where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. The matisense of inhibiting the actient of human mdm2. They may be used for treating an animal having a cheexpression of human mdm2. They may be used for treating an animal having a coverexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, inhorsis, atherosclerosis or restencist, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance.

The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for a detecting the role of mdm2 expression in various cell functions and channel tools. AAS29247-AAS28507 represent the human mdm2 antisense oligonucleotides of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

The adenovirus causes congestion in the conjunctiva and follicular conjunctivitis, and the method of the invention is used for their prevention
                                                                    The present invention relates to antisense compounds, 8-30 nucleobases in

Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis.

Claim 1; Page 47; 169pp; English.

XEFFXXXXCCCCCCCXXXXXCCCCCCXXXXXCCCCCCCCXXXX

The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Herl) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer) and psoriasis. They are also useful as research reagents, diagnostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1

Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins

Example 2; Page 13; 21pp; English.

molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for The invention relates to antisense compounds targeted to a nucleic acid

inhibiting the expression of STAT3 in cells or tissues, inducing Fasmediated apoptosis in cells, and sensitiaing cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune disease, particularly rheumatoid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myelomas, melanomas and lymphomas. Also treatable are human diseases or conditions dharacterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3. The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides

Novel isolated polypeptide comprising variant form of mouse or human SAC1 polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.

Claim 14; Page 93; 239pp; English.

The invention relates to an isolated polypeptide, comprising a variant form of mouse or human \$AC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with \$AC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polynucleotide (other than a naturally occurring chromosome) comprising a sequence encoding a pancreatic progenitor 1 (PPI) protein. The invention also discloses an tibodies raised against the protein. The invention also discloses the polynucleotide and a non-human transgenic animal expressing PPI. The polynucleotide is useful for screening for modulators of PPI. The polynucleotide is useful for screening for modulators of PPI. The polynucleotide is useful for denetherapy, mapping function of its encoded protein, PPI for gene therapy, mapping functional regions of the protein, protein, PPI for gene therapy, mapping functional regions of the protein, transformed with the expression cassette is useful in transplantation to provide a recipient with pancreatic islet cells, including insulin producing beta cells, for drug screening, experimental models of islet differentiation and interaction with other cell types, in vitro screening assays to define growth and differentiation factors, and to additionally characterise genes involved in islet development and regulation. The polynucleotide and PPI protein are useful for analyzing a patient sample
                                                                                                                                                                                                                                                                                                          ;

embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancrees or tongue) for sequence variations of the SAC1 sequence variations of the SAC1 polens may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polynucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pancreatic progenitor 1, PP1, ss; transgenic animal, gene therapy; diabetes; islet cell; PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New pancreatic progenitor 1 gene and polypeptide, useful for treating disorders associated with the protein defects.
                                                                                                                                                                                                                                                                                                          Gaps

ö
for the expression of PP1, or their variants. PP1 genes, gene fragments, its encoded proteins or protein fragments are useful in gene therapy to treat disorders associated with PP1 defects e.g. type I diabetes. The present sequence is a PCR primer used to isolate a nucleic acid molecule encoding PP1

The present invention relates to novel antisense compounds which inhibit the expression of phospholipase A2 (PLAZ), group VI (G24-independent). The invention is useful for inhibiting the expression of PLAZ, group VI (G24-independent) in human cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of human PLAZ, group VI (G22-independent). It is useful for diagnostics, therapeutics and as research formation or inflammation. The present or delay infection, tumour formation or inflammation. The present DNA sequence is an antisense oligonucleotide targetted to human PLAZ, group VI (G22+-independent) DNA
                                                                                                                       Novel antisense compounds useful for inhibiting gene expression of human phospholipase A2, group VI and for treating diseases associated with expression of phospholipase A2, group VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; signal transducer and activator of transcription 3; ischaemia; immune response; Stat3; coronary atherosclerosis; vascular occlusion; hypoziais stroke; anglogenesis; myocardial infarction; hypozipycaemia; inflammation; chronic obstructive pulmonary disease; cardiac arrest; insulin dependent diabetes mellitus; emphysema; trauma; scleroderma; shock; chronic active hepatitis; adult respiratory distress syndrome; nitrogen necrosis; proliferative angiopathy; autoimmune thyroiditis; sjogren's syndrome; multiple sclerosis; Addison's disease; epilepsy; polymyositis; rheumatoid arthritis; autoimmune infertility; anaemia; proliferative disease; derawe, disease; ulcerative colitis; sarcoma; carcinoma; degenerative disorder; gene therapy; growth deficiency; cirrhosis; hypoproliferative disorder; lesion; antisense; ss.

```
The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing hypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infaramation, tissue ischaemia in the lower extremities, infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, tissue ischaemia in the lower extremities, infarction, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, childpsy, emphysema, adult respiratory distress syndrome, cardiac arrest, introgen necrosis, proliferative andiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus erythematosus, multiple sclerosis, insulin dependent diabetes mellitus, sjogren's syndrome, sclerosis, primary bilary cirrhosis, pernicious anaemia, autoimmune thyroiditis, idiopathic Addison's disease, vitiligo, gluten-sensitive enteropathy, autoimmune neutropenia, myasthenia gravis, cidiopathic thrombocyropenia purpura, Grave's disease, goodgesture's some infertility, bullous pemphigoid, discoid lupus, ulcerative colitis and carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leukaemia, chense deposit disease. The method is useful in preventing or treating carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leukaemia, chronic eleukaemia, leukappicus and soused in gene therapy. The present sequence is human Stat3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                              Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator of transcription 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic, cancer; Slug gene; mesenchymal cancer cell; leukaemia; sarcoma; antitumour agent; antisense therapy; ds.

vertebrate sample. The method comprises determining aberrant expression of the Slug gene, relative to a normal control sample. The method is used to detect (for diagnosis, monitoring progression and detection of residual disease after treatment) mesenchymal cancer cells (leukaemia or sarcoma) in humans. Agents that inhibit Slug (at DNA, RNA or protein levels) are potential antitumnour agents. The polymuclecides of the invention can be used in antisense therapy. This polymuclecide sequence represents an oligonucleotide relating to the Slug gene of the invention

The invention relates to a novel pharmaceutical composition, which has a

first active agent comprising an oligonucleotide antisense to the initation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antialfammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchocilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allefamention, lung allefament is not respiratory disease or condition. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure, SEQ ID NO 6053; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has

```
first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 1' end genomic flanking regions, 5' or 1' end genomic flanking regions, 5' unctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention is matchinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antifulammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing or depleting levels of of, or reducing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ftp.wipo.int/pub/published_pct_sequences

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antisthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antialnammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                          ;

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for modulating strapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targeted to human PLA2 DNA. This sequence is used to illustrate the method of the invention
                                                                                   New antisense oligonucleotides for modulating phospholipase A2 group V gene expression, particularly useful for treating an autoimmune disorder or an inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to adipose-derived stem cells (ADSC) and lattices which are useful for generating differentiated tissues and structures both in vivo and in vitro, for producing molecules such as hormones and for providing a conditioned culture media for supporting the growth and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Adipose-derived stem cell; ADSC; transgene; cell therapy; gene therapy; primer; reverse transcription; RT; PCR; nestin; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated adipose-derived stem cell, useful for generating differentiated tissues and structures both in vivo and in vitro or providing conditioned culture media to support the growth and expansion of other cell populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

expansion of other cell populations. Lattices are useful as substrates for facilitating the growth and differentiation of cells into mature tissues or structures. The invention is useful for delivering a transgene to an animal. The invention is also useful in cell therapy and gene therapy. The present sequence is reverse transcription PCR (RT-PCR) primer used to amplify human nestin gene. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention represents a compound 8-50 nucleobases in length which specifically hybridizes with a nucleic acid molecule encoding interleukin and inhibits the expression of interleukin 8. The method is cytostatic and immunosuppressive in its action and is an interleukin 8 inhibitor. The compound, composition and methods are useful for treating a disease or condition associated with interleukin 8, such as hyperproliferative or autoimmune disorder. They are also useful in research and diagnostics for represents an oligonucleotide which inhibits the expression of interleukin 8. The present sequence interleukin 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; immunosuppressive; interleukin 8;

The invention relates to a method for diagnosing multiple sclerosis (MS) or predisposition to the disease in a human patient. The invention is based on the finding that a C to T single nucleotide polymorphism at C based on the finding that a C to T single nucleotide polymorphism at position 1364 of the coding sequence, corresponding to a Thr455ile at predisposition to MS. Individuals homozygous for the C1364T SNP in exon 7 are present in higher numbers in a group of MS patients compared with a normal control population, indicating that the effect of inAG3 (Thr455ile) on MS susceptibility is recessive, which could relate to the functional structure of LAG3 on the cell membrane. The invention also encompasses the additional determination of the Sequence at the polymorphic sites the additional determination of the LAG3 gene, methods of screening for compounds that can be used to detect the 1364T SNP in the LAG3 ene, and an antibody specific for the 455ile variant of the LAG3 cene, and an antibody specific for the 455ile variant of the LAG3 cene, and an antibody specific for the disease in a human patient, and for screening for modulators of LAG3 activity which can be used to treat MS. CC AG3 gene, and can be used in genetic testing kits for diagnosing min the CLAG3 gene, and can be used in genetic testing kits for diagnosing min the CLAG3 gene, and can be used in genetic testing kits for diagnosing multiple sclerosis or a predisposition to the disease. Sequences ADA26248 corrections of the invention and man indiagnosing min the CLAG3 gene, and can be used in genetic testing kits for diagnosing manification and man
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnosing multiple sclerosis or predisposition to the disease in a human subject, comprises genetic analysis of the LAG3 gene or protein, e.g. identifying polymorphism in the LAG3 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

the primers ABV77208-09 were used to amplify a consensus region of the human mu-opicid receptor (hMOR). This opicid receptor belongs to the Granton contain coupled receptor (BCRE) family. The amplified fragment was used to produce a GPCR array of the invention. The specification describes a GPCR array comprising a multiplicity of individual polynucleotide spots standard a solid support. The individual GPCR polynucleotide spot comprises a GPCR polynucleotide composition consisting a non-conserved region of a GPCR polynucleotide family member, where the spots represent at least two different regions of a GPCR polynucleotide family member. The GPCR array is useful for determining the pathogenesis of different ion-related conditions or diseases in humans, e.g. asthma, diabetes, AIDS, allergies, dermattis, psoriassis, narcolepsy, viral or parasitic infections, transplant rejection, lupus, hepatitis, autism, cancer, renal disorders, etc
                                                                                                                                                                                                                                                                                                                                                                                  New G-protein coupled receptor array comprising individual polynucleotide spots stably associated with a surface and a solid support useful for determining the pathogenesis of different ion-related conditions or diseases in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, CD36 antigen-like 1, CD36L1; scavenger receptor class B type 1,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method and a kit for determining the expression of mRNA or cDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMA3, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, NMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type I collagen alpha 2 chain, type IV collagen alpha 1 chain, type IV collagen alpha 2 chain, TMP-1, TMMP-2 and TMMP-3. The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an oligonucleotide upto 30 mucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TNF)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rheumatoid attritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and hepatitis in an individual. This sequence represents an antisense of inflammatory when individual this sequence represents an antisense of the colliponucleotide used to modulate expression of tumour necrosis factor
                                                                                                                                                                                                                                                                                                                           Treating inflammatory disorders such as inflammatory bowel disease,
Crohn's disease or rheumatoid arthritis, in a subject, by administering
oligonucleotide which inhibits expression of human tumor necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cartilage growth, cartilage differentiation; cartilage disorders; rheumatoid arthritis; osteoarthritis; osteoporosis; human; NPATp; calcineurin-interacting region; ss; RT-PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to antisense compounds, compositions and methods for modulating the expression of class B scavenger receptor, CD36 antigen-like I (CD36L1). CD36L11 is also known as scavenger receptor class B type I (SRB1), CLA-1 and mouse homologue, SR-BI. The antisense compound is useful for preparing a composition for treating metabolic or cardiovascular disorder, e.g. altered lipid metabolism or atherosclerosis. It is also used in gene therapy. The present sequence is an antisense oligonucleotide targetted to human CD36L1 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tumour necrosis factor alpha, TNP-alpha, antiinflammatory, antirheumatic, antidiabetic; dermatological, hepatotropic; antiasthmatic, inflammatory disorder, inflammatory bowel disease, Crohn's disease, colitis; rheumatoid arthritis, diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, hepatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compound, having a sequence targeted to a nucleic acid encoding CD36L1, useful for preparing a composition for treating hyperproliferative or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                           The invention relates to a method of identifying a compound that modulates cartilage growth or differentiation. The method is useful for differentiation a compound that modulates cartilage growth and/or modulating. The compound identified by the method is useful for modulating cartilage cell growth and/or differentiation, and thus in the treatment of disorders, e.g. rheumatoid arthritis, osteoarthritis and osteoporosis. The present sequence represents a human cartilage culture reverse transcriptase (RT)-PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting
                                                                                           treating osteoarthritis, by determining effect of the compound on cartilage cells with/without nuclear factor of activated cells (NFATD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chiang MY;

disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligomucleotides are also useful for modulating appetosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligomucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method for determining the risk of periodontal disease. The method involves a 35 kDa protein being fractionated from the saliva of a patient and the intensity of the 35 kDa band determined - a high concentration of the protein indicates a high risk. The method of the invention is useful for determining the risk of periodontal disease in a patient. The present DNA sequence represents a PCR primer that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       당
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       assay of 35 kDa protein in saliva for determining the risk

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel compound targeted to a nucleic acid molecule encoding a B-cell associated protein (BAP), where the compound specifically hybridises with the nucleic acid and inhibits expression of the protein. The compound of the invention demonstrates cytostatic, antinflammatory and antimicrobial activities and may be useful for inhibiting the expression of BAP in cells or tissues thus, via antisense therapy, preventing a hyperproliferative disorder such as cancer, particularly breast or prostate cancer, as well as a disorder characterised by altered levels of apoptosis, infection or inflammation. The current sequence is that of the human B-cell associated protein-targeted antisense oligonucleotide of the invention which comprises 2'-mothoxyethyl) "wings and a phosphorothioate backbone. In addition, all cytidine residues are 5' methylcytidines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound that hybridizes and inhibits a nucleic acid encoding a B-cell associated protein, useful for treating animal having disease or condition associated with B-cell associated protein, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Haematopoietic cell, tyrosine kinase, hyperproliferative disorder, cancer, therapy, inflammation, diabetes, viral infection, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human haematopoietic cell tyrosine kinase antisense oligo ISIS #150720.

The invention relates to a compound targetted to a nucleic acid molecule encoding haematopoietic cell protein tyrosine kinase. The compound inhibits the expression of haematopoietic cell protein tyrosine hinase and it specifically hybridises with the nucleic acid molecule encoding the tyrosine kinase or with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the tyrosine kinase. The cartisense compounds are useful for modulating the expression of haematopoietic cell protein tyrosine kinase and treating diseases or conditions associated with the expression of the tyrosine kinase, such as hyperoliferative disorders (e.g. cancer), inflammation, diabetes or a viral infection. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in pathway. The present functions of various members of a biological pathway. The present sequence is human haematopoietic cell tyrosine kinase antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

Human, vascular cell adhesion molecule; VCAM-1; antisense; septic shock; downregulation; inflammation; leukocyte adhesion; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of an antisense oligonuclectide complementary to a region in the precursor or mature mRNA of human vascular cell adhesion molecule VCAM-1. The antisense oligonuclectide (preferably containing phosphorothioate linkages) is used for downregulating VCAM-1 synthesis which in turn results in a reduction in adhesion of leukocytes to the endothelium and hence to a reduced inflammatory response. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                    Antisense oligo:nucleotide(s) for treating septic shock - with sequence complementary to VCAM-1 mRNA transcript.

The present sequence represents oligomucleotide HVLQB which is specific for polymucleotides encoding DNA polymerases from Kaposi's sarcoma herpes virus (KSHV). The oligomucleotide may be used for detecting viral DNA or RNA in a sample of primate origin, especially in the diagnosis of herpes viral infection. Herpes virus DNA polymerases of this invention, may be used in vaccines for the protection against infection by a herpes virus of the KRHVKSHV family. They may also be used in the design and screening of anti-viral drugs. Antibodies raised against the polymerase or fragments of it, may be used in the detection of herpes virus infection and for drug targetting for the therapy of herpes virus
                                                                                                                                                                                                                                                                         Herpes virus DNA polymerase and corresponding nucleotide sequence - used in the detection and treatment of herpes virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA encoding glyco:protein B of Retro:peritoneal fibromatosis and Kaposi's sarcoma associated Herpes viruses - useful in vaccines for treatment of herpes infection or for detection of viral DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

The present sequence is a PCR primer used to amplify the human pS2 gene as a control in the RT-PCR analysis of the human KLK-44 gene. KLK-L1 encodes a kallikrein-like protein. Kallikreins and kallikrein-like protein. Kallikreins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L5, and KLK-L6 is have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .
